Canadian statistical review

A circular library stamp from the University of Toronto. The word "LIBRARY" is at the top, "OCT 14 1986" is in the center, and "University of Toronto" is at the bottom.

Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200)
or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$45.00 Canada, \$54.00 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

- J.S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field
- R.E. Drover — Director, Transportation Division
- B.J. Lynch — Director General, Operations Branch
- J.G. Stinson — Director, CANSIM Operations Division
- G.J. Brackstone — Assistant Chief Statistician, Informatics and Methodology Field

- A. Meguerditchian — Director, International and Financial Economics Division
- L.O. Stone — Director, Population Studies Division
- P.N. Triandafillou — Director, Agriculture/Natural Resources Division
- K. Lal — Director General, System of National Accounts Branch
- D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

HEALTH CARE ACCOUNTS — A CONCEPTUAL FRAMEWORK AND AN ILLUSTRATIVE EXAMPLE*

Preetom S. Sunga
Janet L. Swinamer
National Accounts Development Division

SUMMARY

Canadian statistics of the health care delivery system are generated under a variety of concepts, methodologies, definitions and classifications by the numerous individual units, institutions and organizations involved. This paper presents an overview and a framework for satellite accounts on health care delivery. Its objective is to enable the organization of economic and financial information on health care delivery activities from different sources into a set of consistent statistics detailing current expenditures, current revenues, purposes of spending and source and application of funds in the health care delivery system. It is recognized that this economic framework is only a first stage in establishing a complete health information framework which could link economic with social and demographic data. A sample set of accounts for the province of Ontario in the fiscal year 1977-1978 is presented to demonstrate the feasibility of establishing such satellite accounts.

1.0 INTRODUCTION

In Canada health care is delivered through a complex, multifaceted system — a system which delivers health care in a variety of forms through numerous

institutions and units, — to many individuals and groups within society. The structure of the health care system and the interrelationships which exist within it are not only complex at any point in time but are also constantly changing as new health care delivery methods are introduced, as new policies and programs are implemented and as financing arrangements are altered.

The task of analyzing the health care delivery system might appear to be as complex as the system itself. For the purpose of various analyses related to consumption, delivery or financing of health care, social, demographic and economic statistics can be compiled from administrative information produced by the individual units, institutions and organizations involved with health care delivery. However, such statistics are not always sufficient or adequate for particular health care analyses since these statistics are produced by different groups for different purposes and with a variety of concepts, methodologies, definitions and classifications underlying their production. Thus, although statistics may be available to describe specific elements of the health care system, the conceptual, methodological and definitional differences which exist are not conducive to global, intertemporal and interspatial analyses of the health care system as a whole.

In order to obtain a systematic overview of the health care system, then, it is essential to have a health information framework by which social, de-

* The authors are greatly indebted to colleagues at the Department of Health and Welfare and Statistics Canada, particularly members of the Health Care Accounts Steering Committee, for constructive comments and support in the development of this project.

mographic and economic statistics pertaining to health care activities can be organized and presented in a consistent manner. With this in mind, Statistics Canada and Health and Welfare Canada initiated an interdepartmental project and assigned an interdepartmental team to determine whether relevant statistics could be organized in such a way¹. Early in the team discussions it became evident that such a fully integrated system would be immensely complex and would require extensive time and resources to develop and implement. It was decided, therefore, to initiate the project by creating a set of health care accounts which would organize economic (including financial) information on health care delivery activities. In the end, realization of the magnitude and complexity of the global project, lack of resources associated with budgetary restraints and absence of support under divided jurisdictions in the health care field contributed to the eventual cessation of the project. The exploratory thinking connected with developing a comprehensive health information system and the resulting development of an analytic economic framework for health care delivery, illustrated with the use of data for one province, are articulated in this paper.

The proposed health care accounts framework described here is designed to integrate data from different sources into a coherent financial information framework which promotes the production of a set of consistent statistics detailing current expenditures, current revenues, purpose of spending and source and application of funds within the health care delivery system. The appropriateness of the proposed accounts for the development of a general statistical data base was tested by compiling an illustrative set of accounts for Ontario for the fiscal year 1977-78. These sample accounts are presented and discussed later in the paper.

In providing detailed economic information on the health care delivery system, the proposed health care accounts form a satellite module to the System of National Accounts. Modelling the health care system in this form is useful for policy formulation and analysis because:

- i) it links events in the health care field to the rest of the economy;

- ii) it enables the tracing of shifts in funding patterns within the health care area over time, as for example, between government funding and private funding;
- iii) it facilitates the monitoring of changes in program priorities over time, as for example, between restorative health care and preventive health care.

Satellite modules, similar to the one on health care, could also be developed for other areas of concern, such as education, justice and social protection. It should be noted, however, that in such a case each satellite account would be complete and independent in itself, inasmuch as it would include all entries relevant to that area. This would mean that some overlapping could occur in coverage and in the summing of various satellite accounts data. The combined totals of two or more satellite accounts, therefore, might not be meaningful since certain activities may be considered simultaneously as falling within the scope of several satellite accounts or even be shared between them. Health education, for example, may be considered within both education and health satellite accounts, respectively. In order to enable the user to analyse such accounts separately or in combination with other satellite accounts such potentially "duplicate" entries should be presented in an easily identifiable form within each set of satellite accounts.

The body of the paper is organized as follows: Section 2 provides an overview of economic statistics on health care delivery within the context of a global health care information system; Section 3 contains a description of the health care accounts; Section 4 shows their potential uses; Section 5 describes their scope; Section 6 outlines the availability of present economic health care statistics; Section 7 is an example using actual data for Ontario for the fiscal year 1977-78; and Section 8 consists of conclusions.

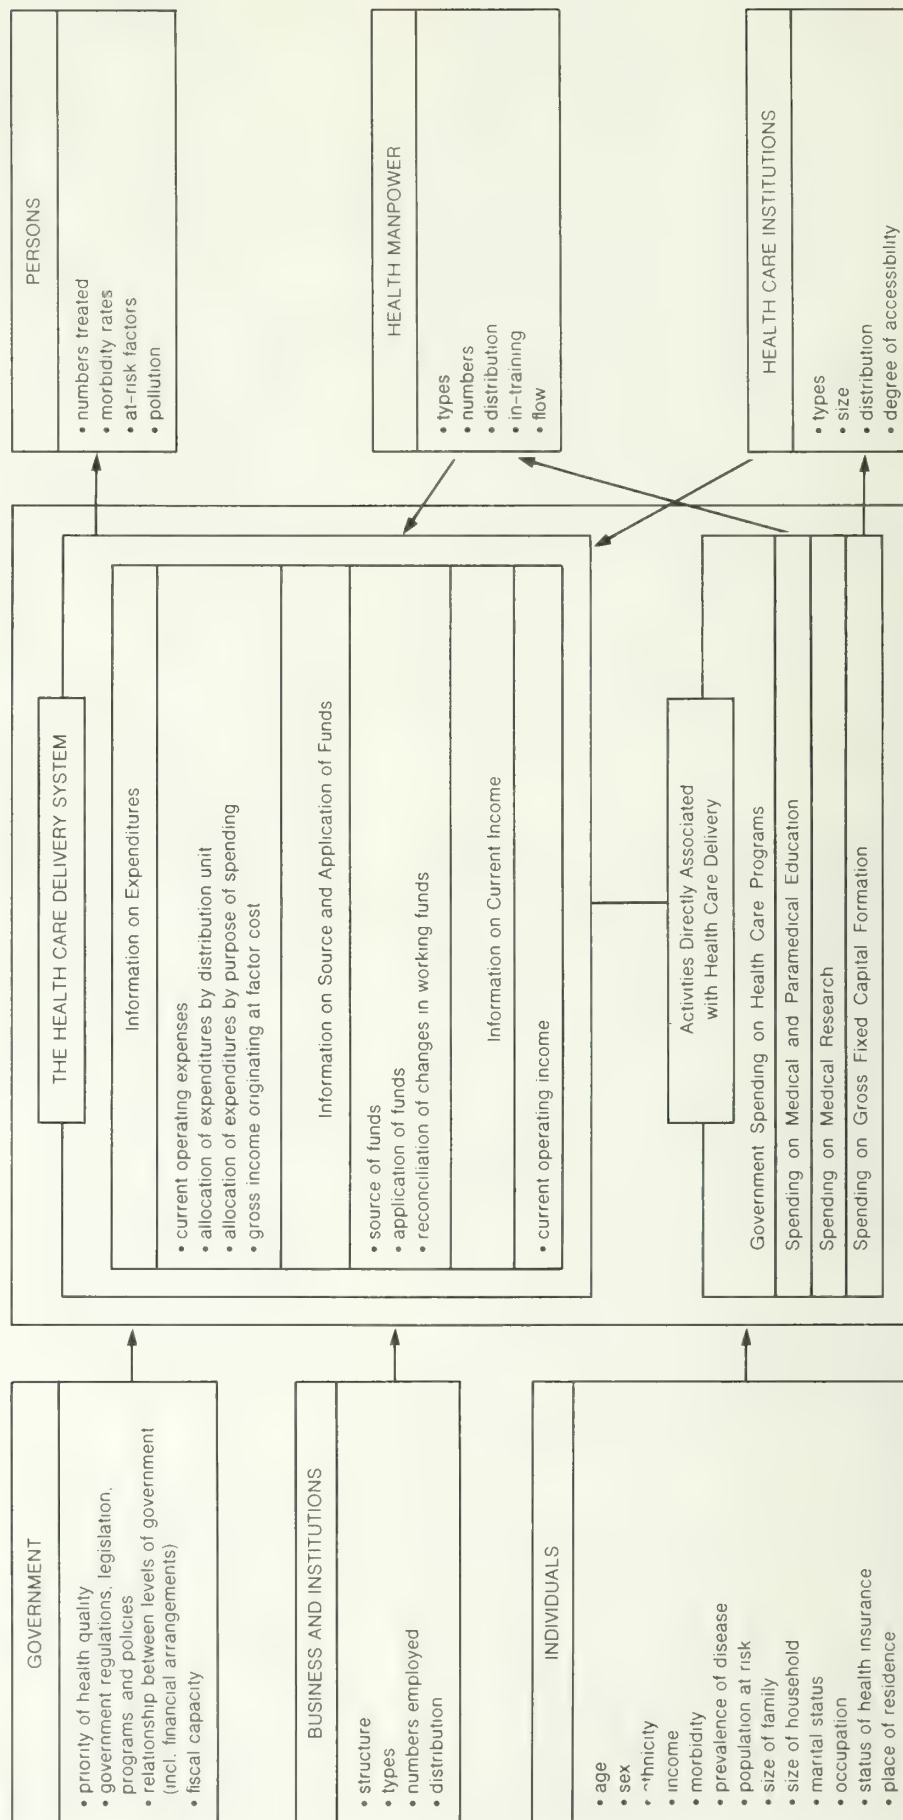

2.0 HEALTH CARE ACCOUNTS WITHIN A COMPLETE HEALTH INFORMATION FRAMEWORK

Chart I, on the following page, summarizes the type of data that could be contained in a complete health care information framework and the role of health care delivery and of economic accounts within it. The chart organizes health care information into three segments that describe the demand for health care, the economic aspects of health care delivery, and the intermediate and final benefits of the health care system.

¹ The initial impetus for this project stems from a 1972 endorsement by the Conference of European Statisticians to study the development of links between the subsystems of the System of Demographic and Social Statistics and the System of National Accounts. A number of papers in this area have been presented since then, most notably by C. Oomens and H. Donkers/J. Bonte from the Netherlands Central Bureau of Statistics, by INSEE, the French National Institute of Statistics and Economic Studies and by A. Foulon.

CHART I
CANADIAN HEALTH CARE DELIVERY
In the Context of a Health Care Information System
Economic Elements of
Health Care Delivery

Intermediate and Final Effects

The left-hand side of Chart I indicates elements which generate or influence the *demand* aspects of the health care system. These are represented by social and demographic statistics which are grouped as those related to government, to business, to institutions and to individuals. The centre part of the chart lists economic and financial statistics which describe the *economic* or financial aspects of the health care delivery system. These economic statistics are directly related to the delivery of health care, e.g. hospital or physician services, as well as to activities which have a direct bearing on the supply of and demand for health care, such as health care programs, medical and paramedical education, and medical research. The right-hand side of Chart I lists types of social and demographic statistics which describe the intermediate and final benefits of the health care system in terms of benefits to persons, characteristics of manpower supplying health care services and the characteristics of health care institutions.

From the vantage point of a complete health information framework the development of economic health care accounts, as presented in this paper, is only one segment of the total system. It is clear, for example, that for the purpose of interspatial comparisons, social and demographic statistics and quantity data must be used in combination with economic statistics. Indeed, for meaningful intertemporal comparisons even the current economic data requires a constant price counterpart.

It might be noted also that the classification and the economic framework presented in the sections following can also serve as categories for organizing social and demographic information, thereby enabling the linking of elements of health care delivery and the intermediate and final effects flowing from the interaction; as outlined in Chart I. Salaries and wages paid to hospital staff, shown under current operating expenses in Table II of the Appendix, for example, can be shown according to occupational categories and linked with data on numbers employed. Similarly, figures of expenditures on direct treatment and care in hospitals, appearing within the expenditure by purpose classification, Table I, can be potentially disaggregated on the basis of age, sex and/or type of disease and care involved and supported by relevant quantity information.

3.0 DESCRIPTION OF THE HEALTH CARE ACCOUNTS

In developing this framework it was recognized that decision-makers within the health care system, whether policy formulators or administrators, have diverse information requirements. To meet these different requirements a flexible framework had to be devised through which health care data could be organized and presented in a variety of ways.

Basically, the health care accounts consist of a set of eight tabulations, each describing some aspect of health care delivery. Chart II identifies the tabulations contained in the health care accounts framework, summarizes the main categories contained in each of them and offers a brief explanation of how each tabulation could be used. The core tabulation, tabulation 1 in Chart II, captures the health care delivery and administrative structure by listing units which deliver and administer health care. This core tabulation can be cross-referenced with tabulations depicting various aspects of the health care delivery sector, specifically those on current expenditures, current revenues and on the source and application of funds. Users of the health care accounts, then, can identify the tabulations which provide the information most relevant for their purposes and cross-reference these tabulations with the core tabulation. Section 7 presents a sample set of accounts for Ontario for 1977-78 and illustrates how various tables can be presented.

4.0 USES OF THE HEALTH CARE ACCOUNTS

The health care accounts were developed to provide decision-makers with both an overview and a detailed account of the health care system. This section articulates some of the potential uses of the health care accounts, specifically, in terms of policy and administrative decision-making.

4.1 The Health Care Accounts for Policy

As indicated in Sections 1 and 2, a complete health care information system to be used for policy formulation and program monitoring should provide, in addition to economic accounts, constant dollar detail of expenditures, physical measures to match the

value data, and performance indicators for monitoring and evaluating performance. While the economic accounts described in this paper do not provide all of these aspects, they do represent a considerable step forward from the existing situation. With further development, it is anticipated that the proposed accounts have potential for facilitating the process of policy formulation and analysis by:

- (i) providing an integrated system within which health care needs and objectives for health planning can be specified;
- (ii) organizing economic statistics in a manner meaningful for meeting administrative and policy needs;
- (iii) providing a tool for simulating the effects of different policy options in the health care system;
- (iv) enabling assessment of costs of various health care programs within a consistent format and for determining that programs and policies are meshed with other plans;
- (v) providing a context in which arrangements for financing health care with respect to transfers between levels of government, insurance companies, compensation boards, persons and delivery units can be examined; and by
- (vi) providing a comprehensive framework to aid the collection and organization of social and demographic statistics into complementary sets of accounts.

4.2 The Health Care Accounts for Administrative Decision-Making

Administrators in the health care field could find the health care accounts useful for enabling comparisons between their individual units and the more aggregate elements of the health care delivery system; specifically, in terms of:

- (i) how individual care units compare in size with portions of or all of the health care delivery system;
- (ii) how decisions made within the individual units affect other components of the health care delivery system;

- (iii) how decisions, resource utilization and economic output of individual delivery units compare to the rest of the system.

5.0 SCOPE AND LIMITATIONS OF THE HEALTH CARE ACCOUNTS

The health care accounts are designed to detail the economic aspects of activities related to the *delivery of health care*. In developing these accounts it was recognized that it is often difficult to make distinctions between terms which define the scope of the accounts and other like terms. Two distinctions of direct concern when defining the scope of the health care accounts are: (i) the difference between activities related to improving health, welfare and well-being and (ii) the difference between the health care delivery sector and the health care production system. These distinctions and their relevance to the development of the health care accounts are described below.

5.1 Distinction Between Activities Related to Health, Welfare and Well-being

Health care activities can be described as activities which are performed for the purpose of preventing deterioration of an individual's health or for restoring the physical and/or mental state of the individual to normality². Social welfare activities, on the other hand, are generally taken to be measures initiated for the purpose of maintaining the income of individuals in situations of involuntary losses of earnings, of providing income assistance to those with inadequate incomes and of providing supportive and developmental services to individuals in need. Thus, while it is clear that hospital expenditures are indeed health care expenditures, other actions, such as promotion of healthy lifestyles, safety in the workplace and provision of old age homes, are more difficult to classify. Part of the reason that boundaries between health and certain social welfare activities are difficult to elucidate is that welfare and health, along with areas such as justice and security, are perceived in this context to be intermediate interrelated goals which are all directed towards the achievement of the ultimate goal of total well-being. Well-being, according to dictionary definitions, is a noun referring to the state of being healthy, happy

² Normal'' health is a reference point, or a norm which in itself is not measurable. Individual perception is a critical element in judging the state of one's health in relation to some notion of homeostasis, i.e., a state of physiological equilibrium.

or prosperous, and therefore subsumes the other two states referred to above.

Within this general perspective the health care accounts have been designed and defined to describe only those activities which are deemed to be undertaken for the main purpose of restoring or protecting health.

5.2 Distinction between Health Care Production and Health Care Delivery

Another distinction which had to be made when defining the scope of the health care accounts was that between health care production and health care delivery.

Health care production refers to activities in all stages of production that have an input into or are part of the final delivery of health care to individuals or groups in society. The process involves the combining of materials and purchased services with factor inputs of labour and capital to carry each stage of the production process forward until health care goods or services are delivered to and consumed by the individual or society. Although intricate input-output matrices describing the health care production process would be useful for certain economic analyses, such matrices might be too "costly" in terms of time, resource and data requirements.

The health care delivery system consists of the providers of health care services, such as healing and recuperative institutions, medical professionals, and other delivery units which are engaged in supplying goods and services directly to the individual for health care purposes. Thus health care delivery represents the last stage of the health care production process since it is that part of the process which interacts directly with individuals or groups within society. The health care accounts were developed to describe the economic aspects of these health care delivery activities. In addition, the health care accounts are designed to describe those activities which do not provide health care directly to individuals, yet have a direct bearing on the supply of and demand for health care, such as the provision of health care programmes by government, medical and paramedical education, and medical research.

6.0 THE AVAILABILITY OF ECONOMIC STATISTICS ON HEALTH CARE DELIVERY

Economic information on the health care delivery system or parts of this system is available through individual organizations related to health care delivery and in the System of National Accounts. This

section reviews these series and summarizes their limitations.

6.1 Statistics of Organizations Related to Health Care Delivery

A multitude of administrative statistics related to health care are available from Canadian health care delivery units and organizations which provide financial or other resources to the health care delivery system. Generally these data are developed in response to varying administrative requirements and as a result, various classifications, definitions, methodologies and concepts are used. These administrative statistics originate with institutions and units which deliver health care directly, with institutions or organizations which participate in the financing of health care delivery activities and/or administer hospital insurance plans or health programs and with institutions or organizations which provide resources to the health care delivery system.

Institutions and units that are responsible for the direct delivery of health care, such as individual hospitals, private nonprofit health organizations, and public health units produce audited financial reports each year. Although the reports provide income and expenditure information, the information varies in detail according to standards set by the individual units. Institutions or organizations which participate in the financing of health care delivery activities or administer health insurance programmes also collect a variety of data pertaining to their activities or programmes.³ The Canadian federal government, for example, has cost-sharing responsibilities for medical care delivered in hospitals and obtains social, demographic and financial data describing the use of these facilities through Statistics Canada, Health and Welfare Canada and a number of other departments. Organizations which provide resources to the health care delivery system produce statistics which detail the supply of and demand for particular

3 It should be noted that at least two government ministries have published compendiums of this type which organize statistics on health care statistics in a province or in Canada, on a global basis. National Health and Welfare, for example regularly produces a compendium containing data on health expenditures in Canada. The data are presented by province and by type of health service provided and indicates the relative contributions of the private and public sectors. The compendium data are on a very aggregate basis, however, and are not designed to provide details on the exact purpose of spending, current operating revenue or the resource utilization of the health care delivery sector. Also, the Ontario Ministry of Treasury and Economics prepared a publication with similar data for Ontario. In addition to providing aggregate data on health expenditures, some detail on resource utilization was provided for some, but not all, segments of the health care delivery sector.

resources. The Canadian Medical Association, for example, maintains a physician resource databank containing factual information useful for estimating the supply and demand for physicians in Canada.

6.2 Statistics in the System of National Accounts

The Canadian System of National Accounts contains considerable data on the health care system although this information is dispersed throughout the various tables and is presented on an aggregate basis. Supplementary tables in the system, however, contain breakdowns showing expenditures on health care activity, as for instance, on medical, hospital and other medical care, respectively; on drugs and sundries within the broad categories of Personal Expenditures on Consumer Goods and Services; and on current expenditure of hospitals on wages and salaries and on other goods and services within the general category of Government Current Expenditures on Goods and Services.

Data on the production of health care goods and services can also be gleaned from Input-Output and Gross Domestic Product publications of the CSNA. However, detail beyond the Standard Industrial Classification categories of: (i) Community, business, and personal service; and (ii) Public administration and defense group (in the major groups of Federal government service industries, Provincial administration industries, and Local administration) are not published.

6.3 Limitations of Current Health Care Data

The existing health care statistics summarized in the previous pages generally suffer from three major limitations:

- (i) dispersion — where detailed statistics on the health care delivery system are not organized into any one statistical framework but instead are spread throughout the ad hoc statistics of health care delivery units and the System of National Accounts;
- (ii) insufficient detail — where statistics on the health care delivery system are given only at broad aggregate levels;

- (iii) noncomparability — where disaggregated statistics are available but classification differences result in a lack of comparability at the more detailed levels.

Thus, although a wealth of economic health care information may be said to exist in a variety of sources, currently none provides an overall view of the funds flowing within the health care delivery sector.

7.0 HEALTH CARE ACCOUNTS — EXAMPLE, ONTARIO, 1977-78

To illustrate the structure of the Health Care Accounts and the workability of the concepts and classifications outlined in Section 4, a set of accounts; given in the Appendix was developed for the Province of Ontario for the fiscal year 1977-78. This section provides a summary of the experience of producing these accounts.

7.1 Difficulties with Data Availability

The sample set of accounts for Ontario illustrates some of the coordinating and organizational advantages offered by health care accounts. As well, the process of producing the accounts revealed the availability and accessibility of good health care data. In some cases, such as general and special hospitals, an abundance of information is collected and easily accessible. For other areas, such as professional services and community health services, data availability or accessibility is a problem. In other instances although information on total revenue or expenditures is available, often there is a lack of detail for reclassification into macro-economic and purpose categories.

The above data weaknesses or insufficiencies limited the number of tables of the health care accounts framework which could be completed for the Province of Ontario for 1977-78. Parenthetically, it might be noted that knowledge of these constraints is in itself an important piece of information for a statistics-gathering agency in that it indicates areas where further data must be developed. In all, five tables have been completed and are discussed and presented in the remainder of this section. Tabulations 2b, 7 and 8, referred to in Chart II, were not prepared as part of this exercise. Tabulations 2 and 6 appear in Table I.

7.2 Interpreting the Tables

Before proceeding to the detail of the tables, it may be helpful to take note of a few technical points.

- a) In Tables I to III double-counting exists in the total expenditures columns due to transfers⁴ of funds which occur in the Canadian Health Care System between one level of government and another and between governments and health care delivery units. To provide meaningful tables, then, the total expenditure figures found in the bottom lines of Tables I to III are in two parts: (i) a total of all direct expenditures excluding transfers and (ii) a second figure, followed by a "T", which indicates the total amount of transfers. It is important to recognize that while certain activities, such as government health care programs, mainly consist of the transferring of funds, there is a contribution to total net expenditure in the health care sector through the costs of administering these programs (labour and intermediate consumption); and
- b) Although great care was taken to allocate data as accurately as possible, the reader should be reminded that the tables are for illustrative purposes only.

Table I of the Appendix casts the relevant information for Ontario in the integrated expenditure framework. The presentation of data within this, and other tables, is fairly straightforward with each line indicating the breakdown of expenditures by various units within the health care delivery and administrative structure. Data on the right-hand side of the table provides detail on the macro-economic allocation of expenditures while data on the left-hand side of the table focuses on the purpose of expenditures. Reference to the first line of the table details the spending pattern of units associated with direct health care delivery in Ontario, which, in 1977-78 spent a total of \$6,151.9 million. The right-hand side of the table indicates that of this amount, \$3,355.2 million was spent on labour; \$943.8 million accrued to unincorporated business as income net of expenses; \$142.7 million was paid as interest on borrowed capital or charged as capital depreciation; \$1,612.3 million was spent on purchases of intermediate goods and services; \$6.3 million was transferred to other parts of the health care system, and

\$91.5 million remained as operating surplus of incorporated institutions or as an unallocated residual.

The left-hand side of the table, which details the purpose of expenditures, indicates that of amounts directly spent by the health care delivery system, \$5,935.2 million went for the purpose of direct treatment and care, \$106.5 million for collective prevention and promotion, and \$12.5 million for medical research. In those instances where a transfer of money is indicated by particular institutions or organizations, the following line in the table indicates the purpose of the transfer with the transferred amounts followed by a small "T". Thus, line 2 of the table indicates that of the \$6.3 million allocated as transfers by Health Care Delivery Units in line 1, \$0.7 million was transferred within the system for the purpose of Direct Treatment and Care and \$5.6 million was transferred for the purpose of Collective Prevention and Promotion.

The remainder of the tables provides further information on the activities of various parts of the Health Care Delivery System and on the Health Care Programs. Table II of the Appendix presents the current operating expenses of the various components of the health care delivery system and its administrative structure. Table III details the purpose of expenditures by each component of the health care delivery system. Table IV summarizes total gross income originating⁵ through the health care delivery system and its administrative structure and indicates the income generated by the various factors of production. Table V shows the current operating revenue of health care delivery units.

8.0 CONCLUSIONS

The development of health care accounts is a complex process. The conceptual framework was shaped through frequent consultations on health information requirements with experts from the health care field, through constant reference to national accounts concepts and through a number of revisions to the framework and its classifications. The framework which resulted from this development process appeared to be viable.

4 The term transfer in this context refers to current transfers by one level of government to another or by government to institutions. For example the federal government makes contributions to provinces under the Health Insurance Plan, and provinces and local governments provide transfers to hospitals.

5 The term "gross income originating" refers to a national accounts aggregate used to measure unduplicated output of individual industries. It is obtained by summing wages and salaries paid, interest paid less interest received, profits before dividends paid or received and depreciation charged.

It was felt, however, that the real test of a framework is whether it can be made operative. A set of illustrative accounts, therefore, was developed for the Province of Ontario for 1977-78. The sample accounts indicate that the framework is viable and that the accounts have potential to provide an impressive amount of information of direct use to a variety of decision-makers and analysts in the health care sector. The exercise also indicates that compiling data on this basis for all provinces for a sufficient number of years to provide a historical series would be, initially, a major task. This is not surprising for a global series; for example, the development of Income and Expenditure Accounts, required considerable time and resources since data sources had to be located and estimation methods devised where no data were available.

Difficulties in obtaining some of the data for the sample Ontario accounts indicated another possible statistical benefit of the accounts framework, that of providing classifications which could be utilized by health care delivery organizations in their generation of health care data.

Gross Domestic Product

Second Quarter 1986

Gross Domestic Product, seasonally adjusted at annual rates, rose to a level of \$501.7 billion in the second quarter, an increase of 1.2%. After allowing for a 0.5% increase in prices, real GDP rose by 0.8%, following a 0.5% gain in the first quarter. The average quarterly gain in real GDP of 0.7% to date in 1986 compares to an average of 1.0% in 1985. The level of GDP is now 3.9% higher than a year ago.

The expansion in the second quarter largely originated in household demand. Consumer demand and housing had slowed in the first quarter, following exceptionally rapid growth in the last half of 1985. Business investment in plant and equipment weakened sharply in the second quarter, while the rate of inventory accumulation slowed. Sharply lower imports accounted for all of the improvement in real net exports, as exports also declined.

Consumer demand for goods and services expanded by 1.0% in volume. Growth in the past four quarters totalled 4.2%. Outlays for goods rose 0.9% after a marginal decline in the first quarter, while demand for services grew steadily at 1.1%. The increase in goods originated in spending on most semi-durable and non-durable goods. Expenditure on durable goods fell, as car sales to date in 1986 have declined slightly after three years of rapid growth.

Spending on residential construction rebounded by 2.0% in volume, following a comparable decline in the previous quarter. The gain was evident both in higher house resales and work-put-in-place, the latter reflecting the sharp growth of new housing starts in the second quarter.

Business investment in plant and equipment recorded a drop of 4.6% in volume, following little

change in the first quarter. The severity of the decline is largely explained by sharp cutbacks in oil and gas exploration and development drilling activity. Investment excluding the energy sector weakened slightly in the quarter.

Total inventory accumulation was little changed in volume terms. Non-farm inventory accumulation eased from a \$5.8 billion annual rate in the first quarter to \$4.4 billion in the second quarter. All of the slowdown originated in the retail trade stocks, after a large increase in the first quarter. A large accumulation in farm inventories offset the non-farm movement as grain stocks rose with exports falling sharply.

Real net exports of goods and services rose by \$2.7 billion in the second quarter, to recoup a decline of similar magnitude in the first quarter. Most of these quarterly movements originated in import volume, up 2.6% in the first quarter and down 4.4% in the second. The drop was particularly evident in automotive products and precious metals. Real export demand edged up in the first quarter before subsiding by 1.8% in the second. Sluggish automotive exports to the United States, weak metal exports and a sharp decline in agricultural commodities, notably wheat, were the major factors in this decline.

The overall implicit price index for expenditure on GDP increased by 0.5% in the quarter, a continuation of the moderate price increases of the previous two quarters. Lower prices received for exports for the third consecutive quarter led this restraint. The 1.8% drop in export prices reflected declines for a wide range of primary products, and fabricated materials. Prices for consumer goods and services decelerated to 0.6% in the second quarter, as prices declined sharply for energy products.

Total labour income grew by 0.8% in the second quarter, largely due to gains in the service-producing industries. Personal income rose 1.2%, while a 8.8% jump in personal income tax collections left disposable incomes little changed, after a 2.0% increase in the first quarter.

Total government expenditures, excluding intergovernmental transfers, rose 3.1% in the second quarter after declining slightly in the first. There were increases in all expenditure categories with the largest being in subsidies, reflecting payments made under the Western Grain Stabilization Plan, and in interest on the public debt. Total revenues increased by 2.5%, primarily due to higher personal income taxes and sales taxes. As a result, the deficit of the government sector, seasonally adjusted at annual rates and on a

national accounts basis, rose from \$25.6 billion in the first quarter to \$27.6 billion in the second.

Note: In the published first quarter estimates, many series were noticeably affected by the fact that the Easter holiday fell in the first quarter, rather than the second, the first such instance since 1978. Revisions to individual series for the first quarter include a re-estimation of the seasonal factors in an attempt to adjust for this phenomenon.

Available on CANSIM: matrices 6701-6741, 6641-6642.

A printout containing all tables is also available on the day of release from the Gross National Product Division (\$35/\$140).

Financial Activity in Canada

Second Quarter, 1986

Borrowing by domestic, non-financial sectors in the Canadian economy in the second quarter amounted to \$22.3 billion on conventional capital markets, representing 18% of the value of goods and services produced in the period (not seasonally adjusted). This ratio was a modest increase from the same period in 1985, when \$19.5 billion was raised, equivalent to 17% of GDP.

Most of the strength in capital markets originated in the *household* sector, with somewhat over 40% of the funds so raised. Mortgage demand grew sharply: at \$5.3 billion in net new borrowing it was up 70% from the same quarter in 1985, a quarterly record. This increase was in line with the very strong housing market. Consumer credit, although up sharply from the first quarter, did not register the same rise recorded in the equivalent period in 1985. This may have been attributable, at least in part, to the weaker growth in expenditure on consumer durables, particularly for automobiles.

In contrast to the first quarter, when they accounted for only one quarter of the funds raised by the non-financial sectors on these markets, *government* borrowings amounted to somewhat over a third of the total in the second quarter. Even so this proportion was substantially lower than the average of 45% in the first half of 1985. The lower borrowing, year over year, is almost entirely due to the drop in the federal government's financing needs. Most of the drop was a result of higher direct taxes on persons. The Government of Canada's deficit amounted to 6.5% of GDP in the first half of the year, down from 9.5% in the first six months of 1985. As a result, the federal government's share of the funds raised on conventional capital markets fell to 21% in the second quarter, compared with 37% in the equivalent quarter the year earlier.

The *federal government's* preferred form of financing was Treasury bills, net sales of which amounted to \$4.5 billion. Net marketable bond issues by the Government of Canada amounted to \$3.6 billion. All these issues were in Canadian dollars, with a little under 50% of gross new issues having maturities of 10 years or greater. \$1.4 billion of the outstanding balances on the lines of credit with Canadian and foreign banks was repaid during the period. There were \$2.1 billion in redemptions of Canada Savings Bonds, which was higher than the average for the second quarter in recent years but less than half of the previous quarter. Factors contributing to this slower rate of encashment may have been the improvement in the attractiveness of this instrument (as interest rates on competing instruments came down), and the relatively subdued personal expenditure on durables, which may be more likely to be financed out of savings.

The *provincial government's* deficit reached a quarterly high of \$4.2 billion (not seasonally adjusted). This was financed, in large measure, by bond issues but provincial treasury bills and other short-term paper raised a record \$1.3 billion.

Non-financial private corporations' acquisition of non-financial assets was relatively weak compared with the first quarter, entirely because there was a swing of \$5.3 billion away from inventory accumulation (using raw data). Fixed capital formation, at \$13.1 billion, showed some recovery, although in constant dollars, it is well below the peak of 1981. However, with internally generated funds amounting to \$11.3 billion, this sector's net borrowing requirement was only \$520 million.

The preponderance of short-term issues during the quarter was highlighted by the extent of borrowing via bankers' acceptances by non-financial private corporations. Taken together with commercial paper

issues, this sector of the economy raised \$9.9 billion through short-term paper, the overwhelming component of which was bankers' acceptances. It would appear that a very substantial part of this financing served merely to repay bank loans which fell by close to the same amount, and reversed the movements of the first quarter. This movement away from intermediated funds is part of a wider trend in the OECD countries, but it also reflected the price advantage of short-term paper over bank loans. The yield differential between thirty-day acceptances, for example, and the prime rate widened by about one percentage point.

With borrowings in these two instruments largely offsetting each other, share issues constituted the major vehicle through which funds were raised by non-financial private corporations on conventional markets. Sales of common shares provided somewhat over twice as much as preferred shares. Net bond issues were down sharply from the

previous quarter, returning to the quarterly average of 1985. It is too early to say whether the sharp jump in the first quarter represented an aberration, or whether the weakness in the second quarter will be reversed in the coming quarters. The share and bond issues enabled this sector to continue the improvement in its capital base.

The sharp drop in their loan portfolio meant that the *banks* were able to apply the funds in a variety of ways. They bought \$3.3 billion in Government of Canada Treasury bills, which served to increase their excess secondary reserve ratio to 6.76 at the end of June. In addition, \$1.8 billion was remitted to their subsidiaries and branches abroad, while a further \$2.1 billion was advanced for mortgages.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancés and fiancées. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

¹Includes military pay and allowances. ²These aggregates differ from those shown in earlier publications in that they are on a "domestic" basis and thus include interest and dividends paid to non-residents and exclude interest and dividends received from non-residents. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. An adjustment has been made to take account of the accrued earnings of farm operators arising out of the operations of the Canadian Wheat Board. Book value of inventories is deflated to remove the effect of price changes and the derived physical change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. ⁵See footnote 3, Table 1.2.

¹Includes outlay on new durable assets such as building and highway construction by governments other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ²Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ³The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment (shown in Table 1.1). ⁴See footnote 4, Table 1.1.

⁵Excludes investment income received from non-residents. ⁶Excludes investment income paid to non-residents.

¹The period 1961-1986 was deflated in three time periods 1961-1971; 1971-1981, 1981-1986 with price indexes based on 1961, 1971 and 1981 respectively. The prices were then linked arithmetically at the major group, component and total levels to the 1981 base. The linking process produced residual differences between the sum of the linked groups and linked aggregates. These differences are shown as adjusting entries. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted tax series. ²Includes capital consumption allowances. ³Includes net purchase of existing non-financial assets.

¹These implicit price indexes derived by dividing the value figures in current dollars by the constant dollar figures, are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data for seasonality and therefore may be used as indicators of price changes. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

Source: The Labour Force (71-001), monthly.

¹The number of persons covered by unemployment insurance is an estimate comprising armed forces personnel, beneficiaries and paid workers from the Labour Force Survey. ²Claimants who receive benefits through the Commission's computer pay system during the reference week. ³Benefits paid for adoption, training, work sharing and job creation claims are included in the total benefits paid. ⁴Annual figures are 12-month averages.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

Source: Research Bulletin, Labour Canada.

Table 9: Total number of employees, by industry group, all survey units, Canada, based on the 1970 standard industrial classification

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 2: Manufacturing shipments¹ by industry based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

Year and month	Non-durable goods industries												
	Total shipments	Total	Food	Beverage	Tobacco products	Rubber products	Plastics products	Leather and allied products	Primary textile	Textile products	Clothing	Paper and allied products	Printing publishing and allied

¹Estimates of manufacturers' shipments are based on a monthly survey of a sample of manufacturing establishments benchmarked to the annual Census of Manufactures.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 3: Manufacturing inventories¹ by industry based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

End of period and month	Non-durable goods industries												
	Total inventories owned	Total	Food	Beverage	Tobacco products	Rubber products	Plastics products	Leather and allied products	Primary textile	Textile products	Clothing	Paper and allied products	Printing publishing and allied

¹Separate industries series combined for the Supplementary Classification automotive products, are also components of other classifications. Other economic use classification groups are mutually exclusive and except for rounding differences add to relevant Canada totals in section 6, table 1.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 5: Estimated value of inventories owned and raw materials in manufacturing industries, by economic use classification, based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

End of period and month	Inventories owned				Inventories held Total			Inventories held: raw materials							
	Consumer goods	Non-durable and semi-durable	Capital goods	Con-struction materials and com-ponents	Supple-mentary classi-fication: auto-motive products	Consumer goods	Inter-mediate goods and supplies	Export-orient-ed indus-tries	Consumer goods		Capital goods	Con-struction materials and com-ponents	Inter-mediate goods and supplies	Export-orient-ed indus-tries	Supple-mentary classi-fication: auto-motive products

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export

Sources: Pulpwood and Wood Residue Statistics (25-001), Exports by Commodities (65-004), Statistics Canada; Bulletins of the Canadian Pulp and Paper Association: "Monthly Pulp Summary" and "Monthly Newsprint Statistics".

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

Note: Monthly data includes all producers of electric energy who generate 20 MW h or more per year. The monthly data accounts for approximately 99% of all generation plus 100% of all imports and exports.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.

¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc plus.

²Includes crude oil, condensate and pentanes

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown

¹Total exports includes domestic exports and re-exports, for further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200)
or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montreal	(283-5725)	Regina	(359-5405)
Ottawa	(990-8116)	Edmonton	(420-3027)
Toronto	(973-6586)	Vancouver	(666-3691)

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional references centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$45.00 Canada, \$54.00 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

J.S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field

R.E. Drover — Director, Transportation Division

B.J. Lynch — Director General, Operations Branch

J.G. Stinson — Director, CANSIM Operations Division

G.J. Brackstone — Assistant Chief Statistician, Informatics and Methodology Field

A. Meguerditchian — Director, International and Financial Economics Division

L.O. Stone — Director, Population Studies Division

P.N. Triandafillou — Director, Agriculture/Natural Resources Division

K. Lal — Director General, System of National Accounts Branch

D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

The *Canadian Statistical Review* and other catalogued publications of Statistics Canada, may be ordered from Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6 and remittances made payable to the Receiver General for Canada.

Correspondence should be directed to the *Canadian Statistical Review* CANSIM Division, Statistics Canada, R.H. Coats Tower, Ottawa, Ontario, K1A 0T6.

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Section 3 — Tables 2.1 and 2.2 Gross domestic product by industry at factor cost.

With this release, the estimates of Gross Domestic Product at factor cost by industry incorporated two major statistical changes. From January 1981 to June 1986 the estimates, which were previously based on the 1970 Standard Industrial Classification,

Monthly or quarterly data may not add to totals due to rounding.

are now compiled using the 1980 SIC and are measured in 1981 prices.

It should be noted that real GDP at factor cost differs from the comprehensive measure, GDP at market prices, in that the former does not include the value of indirect taxes less subsidies. The movements of the two may not exactly coincide due to conceptual and statistical differences.

Please note that a new selection of series are available with this issue.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancés and fiancées. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

¹Includes military pay and allowances. ²These aggregates differ from those shown in earlier publications in that they are on a "domestic" basis and thus include interest and dividends paid to non-residents and exclude interest and dividends received from non-residents. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. An adjustment has been made to take account of the accrued earnings of farm operators arising out of the operations of the Canadian Wheat Board. Book value of inventories is deflated to remove the effect of price changes and the derived physical change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. ⁵See footnote 3, Table 1.2.

¹Includes outlay on new durable assets such as building and highway construction by governments other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ²Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ³The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment (shown in Table 1.1). ⁴See footnote 4, Table 1.1. ⁵Excludes investment income received from non-residents. ⁶Excludes investment income paid to non-residents.

¹The period 1961-1986 was deflated in three time periods 1961-1971; 1971-1981; 1981-1986 with price indexes based on 1961, 1971 and 1981 respectively. The prices were then linked arithmetically at the major group, component and total levels to the 1981 base. The linking process produced residual differences between the sum of the linked groups and linked aggregates. These differences are shown as adjusting entries. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹These implicit price indexes derived by dividing the value figures in current dollars by the constant dollar figures, are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data for seasonality and therefore may be used as indicators of price changes. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1982. ²Includes water, fuel and electricity, and traveller accommodation. ³Excludes water, fuel and electricity.

*For further information on the weights and methodology associated with the Consumer Price Index, see "The Consumer Price Index Reference Paper, updating based on 1982 expenditures," cat. 62-553, occasional.

Section 6 • Manufacturing

- 74 1. Total Inventories, Shipments and Orders in Manufacturing
- 75 2. Manufacturing Shipments by Industry
- 77 3. Manufacturing Inventories by Industry
- 79 4. Estimated Value of Shipments and Unfilled Orders by Economic Use Classification
- 80 5. Estimated Value of Inventories Owned and Raw Materials by Economic Use Classification
- 81 6. Estimated Value of Goods in Process and finished Products by Economic Use Classification
- 82 7. Tobacco and Beverages
- 83 9. Footwear
- 84 10. Production of Sawn Lumber
- 84 11. Pulpwood, Wood Pulp and Newsprint
- 85 12. Primary Iron and Steel
- 86 13. New Motor Vehicles
- 87 14. Production of Motor Vehicles in Canada
- 88 15. Refrigerators, Freezers, Washing Machines and Clothes Dryers

Table 1: Total inventories, shipments and orders in manufacturing based on the 1980 standard industrial classification (million dollars)¹. Projected from 1982 Census of Manufactures benchmark.

Year and month	Inventory at end of month									
	Shipments ²	New orders received during month ³	Unfilled orders at end of month	Owned ⁴	Held but not owned	All inventory held				Ratio of inventories owned to shipments
						Total	Raw materials	Goods in process	Finished goods

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.
 Note: All series are subject to revision each year when more recent Census of Manufactures data become available.
 Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 2: Manufacturing shipments¹ by industry based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

¹Total inventories owned by manufacturers including warehouse stocks.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 4: Estimated value of shipments and unfilled orders in manufacturing industries, by economic use classification, based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

Year and month	Shipments ¹							Unfilled orders at end of month						
	Consumer goods			Construction materials and components	Other intermediate goods & supplies	Export-oriented industries	Supplementary classification automotive products	Consumer Goods			Construction materials and components	Other intermediate goods and supplies	Export-oriented industries	Supplementary classification automotive products

¹Separate industries series combined for the Supplementary Classification automotive products, are also components of other classifications. Other economic use classification groups are mutually exclusive and except for rounding differences add to relevant Canada totals in section 6, table 1

Note: All series are subject to revision each year when more recent Census of Manufactures data become available

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 5: Estimated value of inventories owned and raw materials in manufacturing industries, by economic use classification, based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

End of period and month	Inventories owned				Inventories held Total			Inventories held raw materials

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export.

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

¹Gas types are included. ²Includes producers' shipments for export. ³In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. ⁴End of period. ⁵Electric and other. ⁶Excludes apartment type machines. ⁷Excludes other than electric.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown.

¹Total exports includes domestic exports and re-exports, for further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200)
or to the Statistics Canada reference centre in

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montreal	(283-5725)	Regina	(359-5405)
Ottawa	(990-8116)	Edmonton	(420-3027)
Toronto	(973-6586)	Vancouver	(666-3691)

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional references centres.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$45.00 Canada, \$54.00 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

J.S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field
R.E. Drover — Director, Transportation Division
B.J. Lynch — Director General, Operations Branch
E. Boyko — Director, Electronic Data Dissemination Division
G.J. Brackstone — Director General, Methodology Branch

A. Meguerditchian — Director, International and Financial Economics Division
L.O. Stone — Director, Population Studies Division
P.N. Triandafillou — Director, Agriculture/Natural Resources Division
K. Lal — Director General, System of National Accounts Branch
D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

ADJUSTING NET WORTH FOR PRICE CHANGES WITH REFERENCE TO THE CANADIAN SYSTEM OF NATIONAL ACCOUNTS

BY PREETOM S. SUNGA*
Statistics Canada

1.0 INTRODUCTION

This paper is a step towards development of techniques for measuring the effects of specific and overall price changes with respect to income and wealth for all groups of transactors in the economy in the context of the integrated Canadian System of National Accounts (CSNA). The existing national accounts concepts provide for a number of aggregates representing incomes, consumption, savings and nominal net worth. However, value changes in asset holdings and in liabilities are not taken into account when these occur as a consequence of changes in specific prices and from inflation so that the combined effect from underlying shifts in net wealth and in income positions of transactors is not fully revealed by existing concepts or statistics.

One concept which is often considered for the role of such an overall measure is that of comprehensive income, proposed by Hicks in 1946. Hicks defined comprehensive income as the maximum amount which an individual can consume during a given period, and still expect to be as well off at the end of the period as at the beginning. This Hicksian

comprehensive income is, in general terms, the sum of consumption and changes in net worth over the period measured.

Hicksian income reflects the belief that in addition to conventionally measured income, changes in net worth position are also important in the decision making of individuals and other economic entities with regard to expenditures, savings, and investment. The emphasis on the importance of changes in wealth distinguishes this approach from numerous other studies which, with perhaps one exception, focus only on inflationary effect on income, savings and allocation of resources in the economy¹.

Including the introduction the paper is organized into six sections. The second section deals with basic considerations and the rationale for inflation

-
1. Examples of such studies include: those of the Sandilands Committee of the United Kingdom and the Canadian Institute of Chartered Accountants concerned with the consequences of historical cost accounting on corporate profits, taxes and operational viability, the report by Chant and McFetridge for the Canadian Anti-Inflation Board, which discusses the allocative effects of inflation; those of C.T. Taylor and G.V. Jump which focus on inflation effects on reported sectoral saving, and finally, from a public finance perspective, a recent article by Robert Eisner and Paul Pieper on the real value of U.S. federal government debt and Annex F of the April 1983 Canadian budget papers showing federal government deficit in inflation adjusted terms. The exception noted above refers to Jack Hibbert's report to the OECD on a study of the effects of inflation on the measurement of income and saving.

* I am greatly indebted to my colleagues, George Haydu and Martin Methot for their substantial contribution to the development of this paper. Acknowledgements are due to Statistics Canada's International and Financial Economics Division for supplying preliminary balance sheet data and to support personnel and to colleagues and others who provided substantive comments. The views expressed herein, however, are solely the responsibility of the author.

adjustment; the next section deals with measurement in the context of the CSNA; the fourth with methodology of adjusting net worth; the fifth section provides an illustrative analysis of selected data; the sixth section is the conclusion; in addition there is a statistical appendix.

2.0 SOME BASIC CONSIDERATIONS IN ADJUSTING FOR INFLATION

2.1 Comprehensive Income and Changes in Net Worth

Economic behaviour, decision making and command of purchasing power are influenced not only by the size and growth of incomes but also, by the level of and changes in net wealth positions of economic units.

This is especially relevant in periods where there are diverse price movements both with respect to variations in prices of specific items and to general change in price levels, characteristic of inflation. These situations give rise to dissimilar effects on nominal values of net worth. The change in each net worth is dependent on the composition of assets held and debts outstanding and the extent to which those components have been affected by relevant price changes. These perceived reductions or accretions in nominal net worth can have a significant impact on economic decisions.

Conventionally the SNA focusses on individual aggregates of incomes, consumption, savings and net worth. It provides no single measure which encompasses changes in consumption and in wealth to enable assessment of change in the overall economic position of transactors. The concept which comes closest to meeting such a requirement is that of comprehensive income, proposed by Hicks. Hicks' exposition of comprehensive income, however, is somewhat unclear and parts of it are subject to different interpretations. One interpretation, by Peter Hill is:²

"There is substantial literature on the concept of "income" which predates recent concerns about the measurement of income and saving under inflationary conditions. The most widely accepted definition to be put forward during these early debates was that advanced by Hicks (1946) who defined income as the maximum value which an individual can consume

during a given period and still expect to be as well off at the end of the period as at the beginning. This definition can be rendered more operational by defining income as the maximum amount which can be consumed within any given period while maintaining real net worth intact, which in turn can be translated into actual consumption plus the change in real net worth."

From Peter Hill's interpretation above it is clear that there are two important components of comprehensive income, actual consumption and change in real net worth. In this paper it has been possible only to state the general concept of comprehensive income, articulate the issues involved in the derivation of changes in real net worth and illustrate this by statistical implementation.

Changes in net worth can be readily perceived as being important because net worth, the difference between assets and liabilities, represents the net wealth position of economic units or in aggregate form, of sectors. Assets held in one form or another represent accumulated value and, liabilities outstanding indicate claims or legal obligations which must be met. This net worth, or proprietary right to command resources, provides an indication of the ability of economic transactors to implement economic decisions.

Two types of price changes with potential effect on net worth are considered in this paper. The first of these pertains to changes in prices of specific items or in prices of items related directly to the price movement of items under consideration, such as, for example, changes in interest rate to prices of long-term fixed-money assets held in investment portfolios. Using long term marketable bonds as an example of fixed-money assets, differences between going long-term interest yield rates and rates which prevailed at the time of acquisition of such bonds result in changes between their purchase and market values when the market value is taken at going market quotations. Specific relationship between movements in yield rates and market prices is discussed more fully in the next section. At this point it is sufficient to note that an increase in yield rates is associated with a drop in the value of the instrument and a decline in yield rates with a value increase. Hence one consequence of changes in interest yield rates is a change in net worth.

This effect on net worth, however, is not as clear cut in the case of bonds where the liability of the original issuer remains at the nominal issue price on the books of the issuer and the repayment obligations remain unchanged until maturity date. It has been argued that during the life of the bond the nominal

2. Peter Hill, "Inflation, Holding Gains and Saving," OECD Economic Studies, No. 2 / Spring 1984, OECD, Paris pp. 151-164.

value of the obligation is invariant to changes in market interest yields and therefore the debt figures should not be changed. It can also be argued, however, that if interest rates rise the market places a lower value on the debt obligation represented by the outstanding issue and in such a case, the net worth position of the issuer can be said to have improved relatively to the general economic situation. This is because the issuer can, if he wishes and to the extent available, purchase back his own bonds on the open market at the lower price. Further, even if he opts not to enter the market his competitive position is improved since the relative cost of servicing this debt is lower thereby enhancing his profit position in relation to others who are obliged to borrow at market rates. On this basis, it is concluded that fixed-money liabilities should be treated in the same way as fixed-money assets, that is, adjusted for changes in yield rates even though nominal values remain constant.

A second factor which has the same influence on all values is inflation, i.e., a rise in the general price level which lowers the value of the purchasing power of the monetary unit. Under inflationary conditions holders of fixed value financial assets implicitly suffer a reduction in the value of their holdings, while debt obligations of borrowers are reduced.

The result is a reduction of net worth for asset holders and a gain for debtors.

Holders of tangible assets, on the other hand, may experience either a net gain or loss in the marketable value of their holdings. This depends on whether changes in the specific prices of their assets are larger or smaller than the general change in prices.

Thus, whether due to changes in specific prices or changes in the general price level through inflation, changes in the value of assets or liabilities give rise to implicit transfers of wealth between lenders and borrowers of financial resources, with consequent effects on their net worth and economic behaviour. As well there may also be a change in their positions relative to that of others who hold assets.

2.2 Comprehensive Income - Simple Illustration

Although full procedures for the derivation of comprehensive income are not worked out in this paper the need for the use of a comprehensive income concept in contrast to conventional measures of income for economic analysis might be understood better by a simple example of a person's financial accounts say in periods t-1 and t shown below on both bases.

On a Conventional Basis

(in dollars)

	Year t-1	Year t	Changes between t-1 and t
Income	20,000	20,000	—
Consumption	20,000	30,000	+10,000
<u>Assets</u>			
House	150,000	150,000	—
Bonds	5,000	5,000	—
<u>Liabilities</u>			
Mortgage	50,000	50,000	—
Short-term loan	—	10,000	+10,000
Net Worth (Assets-Liabilities)	105,000	95,000	-10,000

In the above case consumption between period t-1 and t has increased by \$10,000 whereas income has not. The shortfall has been met by a loan of \$10,000 resulting in a drop in net worth of a like amount. It is assumed, however, that in the two

periods there were also changes in relevant prices which contributed to an underlying change in this person's economic position and command over purchasing power. For illustrative purposes the relevant price indexes are as follows:

Price indexes	Year t - 1	Year t
Index of residential construction	100.0	110.0
Long-term bond yields (%)	8.0	10.0
Mortgage rates (%)	12.0	15.0
G.N.E. Implicit Price	100.0	105.0

Applying the Hicksian form of comprehensive income to this case, i.e. actual consumption plus change in real net worth, would result in calculations shown below.

CHART 1 — DERIVATION OF REAL CHANGE IN NET WORTH (in dollars)

	UNADJUSTED BALANCE SHEET		ADJUSTMENT TO BALANCE SHEET		CHANGE	
	Year t-1 (1)	Year t (2)	Gain/loss re. changes in specific prices (3)	Gain/loss re. inflation (4)	Year t adjusted (5)=(2)+(3)+(4)	t - 1 unadjusted to t adjusted (6)=(5)-(1)
Assets						
House	150,000	150,000	15,000	-7,857	157,143	7,143
Bonds	5,000	5,000	-1,000	-190	3,810	-1,190
	<u>155,000</u>	<u>155,000</u>	<u>14,000</u>	<u>-8,047</u>	<u>160,953</u>	<u>5,953</u>
Liabilities						
Mortgage	50,000	50,000	-10,000	-1,905	38,095	-11,905
Short-term Loan	-	10,000	-	-476	9,524	9,524
	<u>50,000</u>	<u>60,000</u>	<u>-10,000</u>	<u>-2,381</u>	<u>47,619</u>	<u>-2,381</u>
Net Worth	105,000	95,000			113,334	
Change in Net Worth t-1 to t		-10,000				+8,334

The adjustment calculations in the chart are obtained as follows. The index of residential construction has moved from 100 to 110; it is assumed, therefore, that the replacement value of the \$150,000 house has increased by \$15,000. In order to simplify the model depreciation on the house has not been taken into account. In the case of bonds, an increase in long term interest yields from 8 to 10 per cent has reduced their market value from \$5,000 to \$4,000. The reduction is based on the fact that at 10%, \$4,000 yields an interest of \$400, the same as \$5,000 did at 8%. The rationale for the mortgage adjustment is similar to that applicable to

bonds, although it might be argued that mortgages do not enjoy a ready after-market. Finally, all items are subjected to the GNE implicit price adjustment to reflect erosion from general inflation in the purchasing power value of dollar denominated assets and liabilities.

Change in the net worth of this household may be analysed either in the conventional way or by taking into account changes in the implicit market value of its assets and liabilities. The two methods yield considerably different results. For example, as noted from chart 1, the conventional approach, yields a

reduction in net worth of \$10,000. Application of adjustments to values, however, results in a positive change in net worth of \$8,334, the difference between \$105,000 at the end of year t-1 and the adjusted position of \$113,334 the end of year t. The amount of the change, calculated at end of year t-1 prices, i.e. those prevailing at the beginning of period t, is composed of a gain of \$5,953 in assets, plus a drop of \$2,381 in liabilities. In this example, although a \$10,000 loan (\$9,524 in t-1 prices) was incurred in year t, there was a net drop of \$2,381 in total liabilities because of the drop in mortgage debt of \$11,905, expressed in t-1 terms.

If one were to proceed towards a derivation of Hicksian comprehensive income, a concept still in the discussion stage, a comprehensive income of \$38,334 is obtained, compared to the conventionally measured income figure of \$20,000.

2.3 Implicit Price Indexes in Adjustment Calculations

Under conditions of rapid or widespread movement in prices current value series become unsatisfactory as a measure of growth since the underlying "real" changes are masked or obscured by price movements. In this sense "real" refers to quantity or volume represented by value expressed in constant prices. Series in constant prices are obtained by deflation, that is, dividing current market value expenditure by changes in appropriate price indexes.

Specific price indexes are suitable for depicting changes in prices of single or a group of homogeneous commodities. This approach cannot be applied, however, where dissimilar commodities are involved or where the commodity mix forming expenditure series shifts over time. For determining changes in overall prices where composite series are involved such as, for example, personal expenditures on consumer goods and services, an implicit price index is used to represent a weighted average of price indexes specific to each component series.

Implicit price indexes are current rather than base weighted. This feature is essential to the development of Hicks' concept of comprehensive income which calls for changes in real net worth from the beginning to the end of the year. This entails that price indexes used in deflation must be rebased either to the beginning or to the end of the year under consideration. In the case of composite components of net worth the rebasing of the corresponding price index is only meaningful in terms of current weights.

3.0 MEASUREMENT ISSUES IN THE CONTEXT OF THE CSNA

3.1 The Balance Sheet

At the time of the development of this paper only preliminary unpublished data were available and these were used for the calculation of changes in net worth.³ The figures have not been updated partly on account of time considerations and partly because, as noted, the primary objective of this project is the development of requisite concepts and methods; the figures are for illustrative purposes only.

Although it was not possible to develop this paper to the stage of deriving comprehensive income, nevertheless it should be recognized that this concept combines data from both balance sheets and income and expenditure accounts and therefore it might be useful to differentiate some of the basic characteristics of the two set of accounts.

First, income and expenditure accounts are concerned with measuring flows whereas balance sheet accounts are concerned with levels and composition of assets and liabilities. Thus, whereas income and expenditure accounts measure the value of transactions that occur over a period of time, the balance sheet accounts portray values of tangible assets and the composition of a sector's financial structure at a point in time. These differences have implications in the selection of price indexes for deflation and in their time periods which must coincide with that of the value data.

Secondly, the emphasis on sector categories is different between income and expenditure accounts and their balance sheet counterpart with the latter's focus on financial rather than on production and distribution aspects. In the Canadian National Income and Expenditures Accounts, for example, the production account consists of four sectors; Persons and Unincorporated Business, Government, Corporate and Government Business, and Non-Residents. In the National Balance Sheet Accounts there are thirteen major sectors which for the purposes of this paper, have been rearranged as: Persons and Unincorporated Business, Non-Financial Corporations, Banks and Near-banks, Other Financial Institutions, Governments and Rest of the World. The two sets of accounts, are reconcil-

3. Subsequently Statistics Canada has published an updated version of these figures in its publication, "The National Balance Sheet Accounts 1961-1984", System of National Accounts, catalogue number 13-214.

able although the amount of sectoral detail that is deemed appropriate for each will depend on the purpose of analysis and on the data available.

3.2 Valuation in the Balance Sheet Accounts

For sake of consistency and accuracy in this type of exercise, it would be preferable to have balance sheet accounts at uniform current market valuation for all assets and liabilities, across all sectors. Business financial records, however, are not kept on this basis and for many series data are just not available to enable conversion to current market values. Historical cost, i.e. at purchase prices, is the accepted method of recording acquisitions in normal business accounting. For current reporting tangible assets are shown usually at book values which may vary between historical cost and current market value.

Value variation is not a serious problem in the case of short-term financial instruments, where differences between market and book valuations are likely to be small, but on the other hand, long-term instruments usually appear in the Balance Sheet Accounts at different prices. For example, governments and corporations issue marketable bonds which stay on their books at that price until maturity as a part of their liabilities. In the meanwhile these bonds, as financial assets, may be widely traded and held in portfolios of different sectors at different values depending on prices paid at time of purchase. A further complication is the business practice of amortizing the premium or discount from par value over the remaining life of the bond. Therefore the outstandings data for a variety of long-term instruments, such as bonds, are a mixture of valuations for items which for all intents and purposes except price are otherwise identical.

Inconsistent valuation creates some distortions in matching some categories of assets and liabilities. The greatest impact probably occurs in the persons and unincorporated business sector, where data for some series of financial assets and liabilities are derived residually within the overall constraints that assets match liabilities for the balance sheet as a whole.

3.3 Valuation and Adjustment of Net Worth

Despite the mixture of data in the balance sheets which reflect different valuations it is contended that the adjustments of these figures to reflect yearly change in net worth is meaningful. First, and most important, the periods under consideration are in segments of one year, that is, it is the change from

the beginning to the end of year that is being analyzed. It is felt that within the year the composition of assets and of liabilities would not change significantly. Second the magnitude of adjustments, representing capital gains and losses, depends primarily on fluctuations in prices that influence market values of certain components rather than on the incremental changes in the components. Price changes include those in interest yields which affect market values of fixed-money denominated instruments, changes in prices which affect the market value of tangible assets, and changes in general purchasing power of the monetary unit which affect all transactions and values. Third, most long-term balance sheet items are revalued infrequently thus their contribution to change in the aggregates is minimal. Finally short-term assets, by definition turn over rapidly and therefore their book values appear in the records at or near market prices.

The critical requirement for the adjustments under discussion in this study is that balance sheet items, whether shown at book value or recorded on a current basis, remain at a fairly consistently valuation, at least over the intervals under consideration. On this basis it is assumed therefore, that relevant parts of year to year changes in net worth can be obtained through the application of appropriate price indexes to balance sheet items.

3.4 Adjustment Indexes

Two categories of adjustments were carried out. First, capital gains and losses on tangible assets and on long-term financial assets and liabilities were calculated by using price indexes specific to or closely associated with price movements in series under consideration. The item in question, whether an asset or liability and irrespective of sector, was adjusted by the same specific price index. The second is a general adjustment to account for the change in the purchasing power of the monetary unit. This is obtained by using the implicit deflator for Gross National Expenditure.

As described later, the relationship between end of year price levels of the current and the preceding year were used to adjust end of the year balance sheet outstandings figures. Some might argue that mid-year figures instead of year end data, both for outstandings, i.e. balance sheet series, and for prices would have been more appropriate for these calculations as they would better represent the average experience for the periods. It might be recalled however, that these are balance sheet figures which represent the situation at a point in time and not flows which cumulate through the period. Using mid-

year data would serve to distort representation of the actual situation. The concept of comprehensive income, to which these adjustments are tied, is cast with respect to sectoral positions at the beginning and at the end of the period.

3.5 Considerations re Shares, Term Deposits and Currency Valuation

It should be noted that no adjustment is made for specific gains or losses on the holdings of shares, or shares as a liability of the enterprise sector to other sectors, or on term deposits as assets and as liabilities. These items can be significant elements in particular sector balance sheets and their values can fluctuate sharply so that omitting them from items affected by other than general inflationary price changes would seem to call for an explanation.

Shares as asset holdings were not adjusted according to the movement of stock indexes because these shares were recorded at market or close to market price in the balance sheet figures of stock holdings. On this basis these data require no adjustment. A similar reason applies to the liability side since share liabilities are calculated at book value of shareholders equity including retained savings, in other words at the reported net worth of the company.

It might have been noticed that the estimation of capital gains and losses are limited to bonds and mortgages. This ignores the fact that there are financial institutions who typically fund their mortgages with term deposits of equivalent maturity. Thus a large part of capital gains and losses incurred on mortgages extended by these institutions may have been offset by equivalent and offsetting losses and gains on fixed term deposits. This adjustment should, but has not been made.

A final point, all data in the balance sheet are valued in Canadian currency. Non-Canadian currency transactions such as official international reserves and foreign currency denominated investments had already been converted, where possible, to Canadian equivalents with the use of year-end exchange rates when the basic balance sheet series were compiled. To this extent, therefore, gains and losses arising from movements in exchange were already embodied in the net worth figures, and such gains and losses should have been identified. This was not done, however, so that although the aggregate adjustment series in Table 3F would not change, the aggregates are not split between amounts arising from changes in the exchange value of the currency and other.

4.0 METHODOLOGY FOR DERIVING ADJUSTMENTS TO NET WORTH

4.1 General

Changes in the value of net worth, represented by the total adjustment shown in Tables 3A through 3F, can occur through changes in prices specifically affecting the current value of particular items or through changes in the general price level.

Adjustments to net worth from these can be decomposed into three components:

- i) gains or losses on tangible assets
- ii) gains or losses on fixed-money assets
- iii) general inflationary gains or losses on tangible assets, and financial assets and liabilities.

The formulae used to calculate the adjustments presented in the appendix are explained in the following sections.

4.2 Gains and Losses on Tangible Assets

The preliminary balance sheet data show tangible assets at current values and therefore already include gains due to price changes for such assets. Since an objective of the analysis is to show such gains explicitly, the amount of this gain GLTA_t was subtracted from the balance sheet data and added back in Tables 3A - 3F. The calculation of GLTA_t is discussed below. An example of the treatment of this gain, for the personal sector in 1983, is the following.

Preliminary series (not shown in tables)	\$ 943,026
Less gain on tangible assets (Table 3A)	10,376
Unadjusted series (Table 2)	932,650
Gain on tangible assets (Table 3A)	\$ 10,376
All other adjustments (Table 3A)	-45,147
Total	-34,771
	\$ 932,650
	-34,771
Adjusted series (Table 2)	897,879

With this treatment the unadjusted series rather than the preliminary becomes the base figure for comparison with the adjusted series. It might be noted that all adjustments, including the one for tangible gains, are grouped together in Tables 3A - 3F.

The adjustment to tangible assets can be expressed as:

$$GLTA_t = TA_t \times ((PTA_t - PTA_{t-1}) / PTA_t)$$

where

$$GLTA_t = \text{Gains or losses on tangible assets for year } t$$

$$TA_t = \text{Tangible assets at current values for year } t$$

$$PTA_t = \text{Price index for tangible assets for year } t$$

Specific indexes used for determining approximate gains or losses on tangible assets were as follows:

- i) Residential Structures - GNE residential construction implicit deflator
- ii) Non-residential Structures - GNE non-residential construction implicit deflator
- iii) Machinery and Equipment - GNE machinery and equipment implicit deflator
- iv) Consumer Durables - GNE consumer durables implicit deflator
- v) Inventories - GNE non-farm business inventories deflator
- vi) Land - Consumer Price Index

In addition, tangible assets, like all others, are subject to the general inflationary adjustment described in Section 4.4.

4.3 Gains and Losses on Bonds and Mortgages

Adjustment for gains or losses on fixed-money denominated instruments were derived by applying appropriate interest yield rates to the book value series. Long-term bonds for example, were adjusted for gains or losses resulting from changes in interest rates by applying percentage changes in the interest yield rate on long term bonds. It should be noted, however, that non-marketable bonds, such as Canada Saving Bonds and special bonds associated with loans to provincial governments from Canada Pension Plan and Quebec Pension Plan funds were not subjected to the interest yield adjustment. By special arrangement these bonds are not traded in the market and can only be sold back to the issuer at face value. Value figures of mortgages outstanding were adjusted for effect of interest rate changes by the use of five year conventional mortgage interest rate. Although there was considerable shortening of the mortgage period in the 1980's with rises in interest rates, the bulk of mortgages outstanding are assumed to be long term of the series covered.

Theoretically, the formula for adjusting the market prices of debt instruments for changes in interest rates would be as follows:

$$\text{Percent change in market price of bond} = \frac{-1}{1+r} \times \Delta r \times D$$

where: r is the market interest rate
 Δr is the change in the rate
 D is the duration of the bond (or mortgage). Duration (D) is the present-value weighted average term to maturity.

This formula is suited for the adjustment of bond prices when the duration characteristics of individual bonds are known⁴. However, each balance sheet category is an aggregate of issues with different maturities. Data on individual issues are not generally available and therefore, the more approximate formula given below is actually used. It is believed that this approximation is reasonable, given the expository nature of the analysis in Section 5 and the data distortions caused by differing valuations.

Another factor which is not taken into account, either by the formula $-1/(1+r) \times \Delta r \times D$ or by its approximation is the shift in the term structure of a particular instrument. It is believed that usually such shifts are slow, and therefore have little effect on year-to-year adjustments, and that the size of such shifts is small compared to the imperfections in the data.

The approximation for the adjustment to net worth for gains and losses on fixed-money instruments can be expressed as:

$$GLF_t = CF_t \times ((IN_{t-1} - IN_t) / IN_t)$$

for fixed-money assets (column 2 of Table 3)

$$GLF_t = CF_t \times ((IN_t - IN_{t-1}) / IN_t)$$

for fixed-money liabilities (column 3 of Table 3)

where

$$GLF_t = \text{Gains or losses on fixed-money instruments for year } t$$

$$CF_t = \text{Reported value for fixed-money instruments at the end of year } t$$

4. For a fuller discussion on this topic, see "Deep Discount Bonds and Duration", Financial Flows, Third Quarter 1981, Statistics Canada, catalogue no. 13-002, pp. XXIV-XXX.

IN_t = Interest rate for fixed-money instruments at the end of year t
 IN_{t-1} = Interest rate for fixed-money instruments at the end of year $t-1$

4.4 General Inflationary Adjustment

Finally, all series were adjusted by changes in the implicit Gross National Expenditure (GNE) deflator to take into account changes in the general purchasing power of the monetary unit.

The adjustment to net worth for inflation in columns 4, 5 and 6 of Tables 3A through 3F were calculated by the use of the following formulae.

$$\begin{aligned}
 A_t &= CAF_t \times ((P_{t-1} - P_t) / P_t) && \text{for fixed-money assets} \\
 A_t &= C_t \times ((P_{t-1} - P_t) / P_t) && \text{for all tangible assets and all other financial assets} \\
 A_t &= CAF_t \times ((P_t - P_{t-1}) / P_t) && \text{for fixed-money liabilities} \\
 A_t &= C_t \times ((P_t - P_{t-1}) / P_t) && \text{for all other financial liabilities}
 \end{aligned}$$

where

A_t = Adjustment for inflationary gains or losses for year t
 CAF_t = Current value adjusted for gains or losses on fixed-money instruments at the end of year t
 C_t = Current value at the end of year t
 P_t = Price prevailing at the end of year t
 P_{t-1} = Price prevailing at the end of year $t-1$.

5.0 ILLUSTRATIVE ANALYSIS OF DATA

5.1 General

The principal objective in this section is the analysis of figures of real changes in net worth. The analysis utilizes net worth data from the National Balance Sheet Accounts, and therefore allowances should be made for the limitations which were discussed in Section 3. These are the provisional nature of the figures, valuation problems, the fact that foreign denominated assets and liabilities are not separately identified and, the exclusion of stocks and term deposits. In addition, the formula used to calculate the gain or loss on bonds is an approximation.

5.2 Analysis of Changes in Net Worth

The real change in net worth is shown in the second

column for each sector, and for national wealth as a whole in Table 1.

The relationship between Tables 1, 2 and 3 is as follows. Taking as an example the situation of the personal sector for the years 1982 and 1983, unadjusted net worth increased from \$874.5 to \$932.7 billion (Table 2), or by \$58.2 billion. However, on an adjusted basis the net worth of the sector in 1983 is reduced by \$34.8 billion to \$897.9 billion taking into account net gains on real assets, losses on financial assets and general inflationary gains and losses. The details on these losses, and the total loss for the sector is shown in Table 3A.

Therefore, the real change in net worth shown as \$23.4 billion in 1983 in Table 1 can be derived in two ways: first, as the difference between the unadjusted net worth of year $t-1$ and the adjusted net worth of year t respectively, in Table 2; and second, as the subtraction of total sector losses for year t from the unadjusted change in net worth between t and $t-1$. The second approach requires the subtraction of \$34.8 billion (total net adjustment - Table 3A) from \$58.2 billion (change in unadjusted 1982 to 1983 Table 2), to obtain the real change in net worth of \$23.4 billion. In other words losses have reduced the gain in the sector's net worth between 1982 and 1983 from \$58.2 to \$23.4 billion.

Table 1 shows large gains in (unadjusted) net worth for persons and unincorporated business. However, gains in real net worth are much smaller in most years of the 1961-1983 period, and a loss was sustained in 1982. Non-financial corporations appear to have gained in most years on an unadjusted or nominal basis, but on the whole the sector's real gains seem to be larger, in some years far larger, than unadjusted gains. In the government sector the pattern is similar to that of non-financial corporations with the exception of a few more years when real gains are smaller than nominal gains. The small and fluctuating net worth of banks and near-banks (Table 2) translated into a mixed pattern of unadjusted net worth in Table 1. Adjusted net worth is lower than the unadjusted in 15 years out of 22 for this sector, suggesting fairly consistent inflationary losses. The pattern for other financial institutions is similar. The rest of the world sector shows consistent nominal gains in net worth, but either smaller increases or actual decreases in real net worth changes for most years.

A clearer understanding of the patterns shown in Table 1 requires an examination of the detail and the trends in Tables 3A - 3F. The following analysis deals with these and links them in a very rough way to inflation rates in the post - 1975 period.

5.3 Analysis of Gains and Losses by Sector

The net worth of the personal sector has been consistently eroded by general inflationary losses on financial assets (mainly term deposits) in the past decade. These losses were stemmed to some extent in years when the inflation rate diminished, as for example in 1983. The principal long-term liability of the sector is mortgages. The sector tends to gain on these when inflation is high and rising since it is paying off mortgages contracted earlier at lower rates. The reverse is true when the rate of inflation drops. The personal and non-financial corporate sectors are the major holders of real assets. In both cases general inflationary losses on these assets have exceeded unrealized gains in the post-1970 period.

The non-financial corporate sector balance sheet has benefited from the erosion of the value of its loan and bond liabilities through general inflation. These translate into overall gains in net worth for most of the post - 1970 period (Table 3B). In this period net losses were incurred in 1976 and 1982 when drops in interest rates reversed gains resulting from the erosion of liabilities in other years due to interest rate increases.

In the bank and near-banks sector and the other financial institution sector real assets are small compared to the personal and non-financial corporate sectors, and general inflationary losses on financial assets and liabilities net out to a very small number in most years. Therefore gains and losses, particularly on financial assets, largely determine changes in net worth. For banks and near-banks, mortgages form by far the largest part of the assets subject to adjustment. The trend is the opposite and the size is roughly comparable to the mortgage liabilities in the personal sector. Other financial institutions have substantial mortgage and bond holdings. The overall trend for both sectors, appears to be losses in net worth in times of high and rising inflation and gains in periods of lower and falling inflation rates.

Next to non-financial corporations, the other major debtor is government. Comparison of the experience of these two sectors (Tables 3B and 3E) reveals virtually identical trends. The key features are the pattern of gains and losses on bond liabilities depending on inflation rates and the erosion of the real value of the liability on account of inflation leading to positive changes in net worth in most years. As in the case of non-financial corporations, 1976 and 1982 are exceptions, and apparently for the same reasons.

Canada has been a net debtor to the rest of the world in the postwar period. Since this sector is a net supplier of funds to Canada, it is not surprising

that Table 3F bears similarities to 3C and 3D.

Although the change in net worth is negative (or in Canada's favour) in nearly all years, there is some indication that the sector's loss is higher in years with high and rising inflation rates, for example 1978-1981, in parallel with the trend which was identified for financial institutions.

The foregoing analysis suggests that non-financial corporations and government have consistently benefited from changes in net worth which are related to inflation rates while persons and the foreign sector lost. Financial institutions tend to gain in years with low or falling inflation and lose in other years. It is worthwhile recalling that this analysis does not include possible effects on net worth from changes in the value of stocks or of term deposits. The results do, however, indicate that the size of changes in net worth by sector are affected by its composition and the impact of interest and other rate changes.

Table 4 shows relative sector shares of total net worth before and after adjustment for valuation changes in sector assets and liabilities components of net worth. These percentages are based on data from Table 2.

These percentages show that persons and unincorporated business sector share of adjusted total net worth is lower than that indicated by the unadjusted data every year from 1962 to 1983, with the largest differences registered from 1971 on. On the other hand, the relative share of nonfinancial corporations increased during the same period. Banks and other financial institutions indicate a mixed experience, although on balance their data too suggest decreases. Governments on the other hand gained with minor exceptions whereas the rest of the world sector shows declines for most years.

6.0 CONCLUSION

A number of points emerged in the development of this paper which are summarized below.

- a) The conventional measures of income are incomplete and inadequate for some types of analysis of economic behaviour especially in the presence of significant price changes. A more suitable measure for this purpose is comprehensive income along the lines formulated by Hicks. Comprehensive income consists of consumption in a given period plus the real change in net worth between the beginning and end of that period. Further research is required, however, to ensure that this interpretation is fully consistent with the Hicksian concept.

- b) The paper develops a method for operationalizing the part of the concept pertaining to net worth in order to determine effects of price changes on sectoral net wealth positions in any given year. It uses balance sheet data for Canada, for 1961-1983 according to a six sector breakout of the economy. The result is an illustrative calculation of changes in real net worth, from which preliminary analysis is provided.
- c) The analysis is considered preliminary on account of a number of statistical shortcomings, i.e., relationship between interest yields and capital gains and losses, estimation of gains and losses on term deposits, valuation problems, and because the meaning of corporate net worth needs further examination and refinement.
- d) Although not specifically discussed in the paper, it might also be mentioned that research associated with the paper raised questions with respect to the current treatment of the inventory valuation adjustment, purchases of land and the capitalization of consumer durables. It is hoped that some attention will be directed to the resolution of these issues in the not too distant future.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancés and fiancées. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

Section 3 • System of National Accounts

- 1. Income and Expenditure Accounts
 - 18 1.1 Gross Domestic Product, Income Based
 - 18 1.2 Gross Domestic Product, Expenditure Based
 - 19 1.3 Gross Domestic Product at 1981 Prices, Expenditure Based
 - 19 1.4 Relation Between Gross Domestic Product at Market Prices, Gross National Product at Market Prices, and Net National Income at Factor Cost
 - 20 1.5 Sources and Disposition of Gross Saving
 - 20 1.6 Sources and Disposition of Personal Income
 - 21 1.7 Personal Expenditure on Consumer Goods and Services by Type of Expenditure
 - 22 1.8 Personal Expenditure on Consumer Goods and Services by Type of Expenditure, at 1981 Prices
 - 22 1.9 Government Sector Revenue and Expenditure
 - 23 1.10 Federal Government Revenue and Expenditure
 - 24 1.11 Provincial Government Revenue and Expenditure
 - 25 1.12 Local Government Revenue and Expenditure
 - 26 1.13 Hospital Revenue and Expenditure
 - 26 1.14 Canada and Quebec Pension Plan Revenue and Expenditure
 - 27 1.15 Implicit Price Indexes, Gross Domestic Product, (1981=100). Seasonally Adjusted at Annual Rates
- 2. Domestic Product by Industry at Factor Cost
 - 28 2.1 Gross Domestic Product by Industry at Factor Cost in 1981 prices, Quarterly
 - 30 2.2 Gross Domestic Product by Industry at Factor Cost in 1981 Prices, Monthly
- 3. Balance of International Payments
 - 37 3.1 Canadian Balance of International Payments, Current Account, All Countries
 - 38 3.2 Canadian Balance of International Payments, Current Account, Area Distribution
 - 39 3.3 Canadian Balance of International Payments, Capital Account, All Countries

¹Includes military pay and allowances. ²These aggregates differ from those shown in earlier publications in that they are on a "domestic" basis and thus include interest and dividends paid to non-residents and exclude interest and dividends received from non-residents. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. An adjustment has been made to take account of the accrued earnings of farm operators arising out of the operations of the Canadian Wheat Board. Book value of inventories is deflated to remove the effect of price changes and the derived physical change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. ⁵See footnote 3, Table 1.2

¹Includes outlay on new durable assets such as building and highway construction by governments other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ²Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ³The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment (shown in Table 1.1). ⁴See footnote 4, Table 1.1

⁵Excludes investment income received from non-residents. ⁶Excludes investment income paid to non-residents

¹The period 1961-1986 was deflated in three time periods 1961-1971, 1971-1981, 1981-1986 with price indexes based on 1961, 1971 and 1981 respectively. The prices were then linked arithmetically at the major group, component and total levels to the 1981 base. The linking process produced residual differences between the sum of the linked groups and linked aggregates. These differences are shown as adjusting entries. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹Gross National Product at 1981 prices can be calculated by deflating net investment income from non-residents with the overall Gross Domestic Product implicit price index and adding the result to Gross Domestic Product at 1981 prices.

¹The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted tax series. ²Includes capital consumption allowances. ³Includes net purchase of existing non-financial assets

¹These implicit price indexes derived by dividing the value figures in current dollars by the constant dollar figures, are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data for seasonality and therefore may be used as indicators of price changes. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

¹The number of persons covered by unemployment insurance is an estimate comprising armed forces personnel, beneficiaries and paid workers from the Labour Force Survey. ²Claimants who receive benefits through the Commission's computer pay system during the reference week. ³Benefits paid for adoption, training, work sharing and job creation claims are included in the total benefits paid. ⁴Annual figures are 12-month averages. ⁵Source: Unemployment Insurance Statistics (73-001), Statistics Canada. For further details, see introduction and technical notes in Cat. 73-202S, Annual Supplement to 73-001 Monthly.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

Canada (1981 = 100)

All items indexes for certain regional cities

(1981 = 100)

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1982. ²Includes water, fuel and electricity, and traveller accommodation. ³Excludes water, fuel and electricity

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 2: Manufacturing shipments¹ by industry based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

¹Pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ²Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ³Customs exports. ⁴Mill shipments destined for export.

Sources: Pulpwood and Wood Residue Statistics (25-001), Exports by Commodities (65-004), Statistics Canada; Bulletins of the Canadian Pulp and Paper Association: "Monthly Pulp Summary" and "Monthly Newsprint Statistics".

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.

¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc plus²Includes crude oil, condensate and pentanes

Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown.

¹Total exports includes domestic exports and re-exports, for further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. ⁶Allowance for the take-over of Nova Scotia Light & Power common shares.

Canadian statistical review

December 1986

Data in Many Forms..

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

CANSIM Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-8200)
or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Sturgeon Falls	(753-4888)
Halifax	(426-5331)	Winnipeg	(949-4020)
Montreal	(283-5725)	Regina	(359-5405)
Ottawa	(990-8116)	Edmonton	(420-3027)
Toronto	(973-6586)	Vancouver	(666-3691)

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional references centres.

Canadian Statistical Review

Data in this publication were retrieved from CANSIM† (Official Mark of Statistics Canada for its Canadian Socio-Economic Information Management System), and processed to create a photo-ready copy from which this publication was produced. CANSIM is the Statistics Canada computerized data bank; series published in this Review (as well as other data) are available on computer printouts, cards, tape or directly via terminal.

The identification numbers at the top of each column of data refer to the unadjusted and seasonally adjusted monthly or quarterly data in this column. Series maintained by Statistics Canada carry a "D" prefix (e.g. D 1375). The "B" prefix (e.g. B 1437) identifies series in CANSIM which are maintained by the Bank of Canada.

More details on which data is available can be found in the following:

CANSIM Main Base Series Directory, 1984 — \$75.00 Canada, \$90.00 other countries

The Directory includes an index which serves to identify, at a fairly aggregative level, the contents of the CANSIM database. This index provides a key to the Series Directory and is the first step in locating series from the CANSIM Main Base.

This Directory is a detailed guide to the data on the CANSIM Main Base. It gives the title, start date, source of the data, and other descriptive material.

CANSIM Mini Base Series Directory, Catalogue 12-569 — \$45.00 Canada, \$54.00 other countries

This Directory is a detailed guide to the data on the CANSIM Mini Base — a standard subset of data originating from the CANSIM Main Base which is available at various Secondary Distributors.

CANSIM-Cross Classified Data Base Index — \$7

This index provides a summary of available data on the Cross Classified Data Base.

CANSIM-Cross Classified Data Base Directory — \$20

This directory provides a detailed guide to the Cross Classified Data Base. It provides a description of the structure of each table.

The seasonal adjustment method applied to economic time series at Statistics Canada is a computerized ratio-to-moving average method. The standard computer program used is the Statistics Canada X-11-ARIMA seasonal adjustment method. Seasonal adjustment removes the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing.

While seasonal adjustment allows a much better look at the underlying trend of a series, the adjusted series will contain irregular fluctuations. Small changes between months in the adjusted series may simply be erratic movements and, to obtain a clearer idea of the underlying trend, users should examine the adjusted series over a number of months. The MCD, or Months for Cyclical Dominance, in a table containing seasonally adjusted series, indicates the smallest span of months for which the average percent change without regard to sign in the trend cycle is greater than that in the irregular factor. For the smoothest series in MCD is 1, for the most erratic series it is 6. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.

Editorial Board

This publication is produced under the guidance of the Canadian Statistical Review Editorial Board, composed of the following members:

- S. Wells (Acting Chairman) — Assistant Chief Statistician, National Accounts and Analytical Services Field
- E. Drover — Director, Transportation Division
- J. Lynch — Director General, Operations Branch
- Boyko — Director, Electronic Data Dissemination Division
- J. Brackstone — Director General, Methodology Branch

- A. Meguerditchian — Director, International and Financial Economics Division
- L.O. Stone — Director, Population Studies Division
- P.N. Triandafillou — Director, Agriculture/Natural Resources Division
- K. Lal — Director General, System of National Accounts Branch
- D. Bergeron — Editor, Canadian Statistical Review

Inquiries about the contents of the Canadian Statistical Review should be directed to the editor at: CANSIM Division, 9th Floor, R.H. Coats Bldg., Tunney's Pasture, Ottawa, Ontario, K1A 0T6.

Subscriptions

Note to Users

This section is used to announce changes in tables of the *Canadian Statistical Review* and in related CANSIM series.

Monthly or quarterly data may not add to totals due to rounding.

Gross Domestic Product

Third Quarter 1986

Gross domestic product at market prices grew by 1.5% to a level of \$509.4 billion, seasonally adjusted at annual rates, in the third quarter. After allowing for price changes, real GDP expanded by 0.3%, following growth of 0.6% and 0.8% in the first and second quarters respectively.

The growth in real GDP reflected a sharp gain in final domestic demand, spearheaded by higher household spending, and increased exports, up 0.3% in volume. Most of the increase, however, was met by higher imports and a decline in inventory accumulation. Output in the goods producing industries declined for the second consecutive quarter while output in the service producing industries continued to rise.

Components of Demand

Consumer demand for goods and services continued to accelerate, rising 1.8% in volume in the third quarter. Purchases of goods jumped by 2.2%, fuelled by a 4.5% increase in durable goods. New car and truck sales rose 10.6%, while outlays for furniture and appliances also strengthened in line with the gain in housing. Spending on semi- and non-durable goods rose by about 1%, while consumption of services rose at the same rate as in the second quarter (1.4%). The sharp increase in demand for motor vehicles was met by a rundown of motor vehicles inventories.

Investment in housing grew by 3.9% in volume. The increase was led by sharply higher transfer costs on sales of existing homes, along with further gains in new construction. The concentration of higher housing demand in central Canada, where price increases have been relatively higher than in the rest of Canada, led to a 3.4% increase in the implicit price index for housing.

Business investment in plant and equipment decreased by 1.3% in volume, following a drop of 3.9% in the second quarter. Outlays for machinery and equipment rose by 3%, after marginal gains in the first half of the year. Increased spending on transportation equipment accounted for much of the upturn. Expenditures on non-residential construction decreased by 6.8%, after a 9% drop last quarter. A sharp drop in spending on exploration and development for oil and gas was concentrated early in the quarter.

Total non-farm inventories recorded a sharply reduced rate of accumulation in the third quarter, up \$3.5 billion compared to \$5.0 billion in the second. The slowdown was largely attributed to the rundown in motor vehicle stocks at the retail and wholesale level in line with strong final demand and a decline in domestic production. In addition, there were large decumulations of lumber inventories at the manufacturing and wholesale level. This coincides with strong domestic demand for lumber products as a result of the increase in residential construction and lower production at the sawmills (attributable to strike activity during the quarter).

Growth in real merchandise imports was widespread. In particular, there was a large increase recorded in refined petroleum products. Smaller, but widespread, gains of imports of household goods were in line with strong personal spending. The 2.7% increase in real merchandise exports accompanied a pick-up in growth in the U.S. economy. On the service side, travel receipts increased sharply reflecting the effect of EXPO 86.

Production by Industry

On an industry basis, virtually all of the growth in the third quarter originated among the service pro-

ducing industries, as was the case in the second quarter. In both the second and third quarters, goods producing industries posted declines in output, marking the first occasion in the current expansion that consecutive quarterly output decreases were recorded.

Most of the growth in the third quarter occurred in those community, business and personal service industries particularly affected by EXPO 86, as well as in wholesale and retail trade, in line with the strength in final domestic demand. The most notable output declines were recorded in the mining, manufacturing and non-residential construction industries.

Components of Income

Both labour income and corporate profits rose about 1% in the third quarter. These gains in income were partly offset by a sharp drop in net farm income. The weakness in farm income slowed the growth of personal income, while disposable income was virtu-

ally unchanged in the quarter. Together with the sharp gain in personal spending, the personal savings rate dropped from 11.6% to 9.1% in the quarter, its lowest level since 1974.

The government sector deficit, on a national accounts basis, decreased \$6.4 billion to a seasonally adjusted rate of \$22.2 billion in the third quarter. Revenues advanced 2.7%, due to higher returns from personal direct taxes and indirect taxes. Total expenditures declined slightly as increases in spending on goods and services and transfers to persons were more than offset by lower outlays for agricultural subsidies from the irregularly high second quarter level, and for interest on the public debt.

Available on CANSIM: matrices 6701-6741, 6641-6642.

A printout containing all tables is also available on the day of release from the Income and Expenditure Accounts Division (\$35/\$140).

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1971 Census; see Occupational Classification Manual, Census of Canada, 1971, Catalogue Number 12-536E, Vol. I. ²Beginning with 1978, this is subdivided into entrepreneurs and managers-administrators. For breakdown refer to CANSIM main base. ³Includes logging, fishing, trapping and hunting. ⁴Includes mechanical and construction. ⁵Includes a small number in non-specified occupations. ⁶Beginning with 1978 includes fiancées and fiancés. ⁷Does not include students entering Canada on students' visas. ⁸Includes also retired persons, elderly dependents, and other unspecified persons.

¹Includes military pay and allowances. ²These aggregates differ from those shown in earlier publications in that they are on a "domestic" basis and thus include interest and dividends paid to non-residents and exclude interest and dividends received from non-residents. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. An adjustment has been made to take account of the accrued earnings of farm operators arising out of the operations of the Canadian Wheat Board. Book value of inventories is deflated to remove the effect of price changes and the derived physical change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. ⁵See footnote 3, Table 1.2

¹Includes outlay on new durable assets such as building and highway construction by governments other than government business enterprises. Excludes defence construction and equipment which is defined as current expenditure. ²Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of existing fixed assets. ³The book value of inventories is deflated to remove the effect of price change and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between the value of physical change and the change in book value is called the inventory valuation adjustment (shown in Table 1.1). ⁴See footnote 4, Table 1.1

⁵Excludes investment income received from non-residents. ⁶Excludes investment income paid to non-residents

¹The period 1961-1986 was deflated in three time periods 1961-1971, 1971-1981, 1981-1986 with price indexes based on 1961, 1971 and 1981 respectively. The prices were then linked arithmetically at the major group, component and total levels to the 1981 base. The linking process produced residual differences between the sum of the linked groups and linked aggregates. These differences are shown as adjusting entries. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four. Since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted tax series. ²Includes capital consumption allowances. ³Includes net purchase of existing non-financial assets.

¹These implicit price indexes derived by dividing the value figures in current dollars by the constant dollar figures, are current weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted data are less subject to the problem of shifting weights than are similar comparisons based on data for seasonality and therefore may be used as indicators of price changes. ²Excludes investment income received from non-residents. ³Excludes investment income paid to non-residents.

¹The labour force as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex etc.) is the labour force in that group expressed as a percentage of the population for that group. ²The unemployed as a percentage of the labour force. The unemployment rate for a particular group (age, sex etc.) is the unemployed in that group expressed as a percentage of the labour force for that group. Seasonally-adjusted rates are calculated by dividing seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and seasonally-adjusted unemployment (i.e. seasonally-adjusted labour force by summation).

Note: Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. For other explanatory material see notes at the end of Catalogue No. 71-001.

¹Statistics on work stoppages include all strikes and lockouts whether legal or illegal, which last for one-half day or more and amount to 10 or more person-days of time lost. Time lost by workers indirectly affected, such as those laid off because of a work stoppage by other employees, is not included. Data is published 45 days after the end of reference month.

²The industry groups from January 1976 forward, are based on the 1970 Standard Industrial Classification. ³The number of person-days is calculated by multiplying the number of workers involved in a work-stoppage by the number of normal working days during the stoppage. Adjustments are made for establishments on shift work, etc. ⁴The total includes all work stoppages. The agriculture, finance, insurance and real estate and public administration and defence industries are not shown separately. Should strikes occur in these industries, the time lost also will be shown in the total. ⁵Includes publishing and allied industries. ⁶Includes storage and communication industries.

¹These weights, provided as a general guide, show the relative importance of the major components of the C.P.I. They are based on expenditure values derived from quantities and prices of year 1982. ²Includes water, fuel and electricity, and traveller accommodation. ³Excludes water, fuel and electricity.

* For further information on the weights and methodology associated with the Consumer Price Index, see "The Consumer Price Index Reference Paper, updating based on 1982 expenditures," cat. 62-553, occasional.

¹Estimates of manufacturers' shipments, inventories and orders are based on a monthly survey of a sample of manufacturing establishments, benchmarked to the annual census of manufacturers. ²Shipments of goods manufactured within the establishments. ³Total new orders received during the period at estimated selling value, net of cancellations. ⁴Total manufacturing inventory owned by manufacturing establishments. Other inventory such as that of goods purchased for resale is not included.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

¹Total inventories owned by manufacturers including warehouse stocks

Note: All series are subject to revision each year when more recent Census of Manufactures data become available

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), Statistics Canada.

Table 4: Estimated value of shipments and unfilled orders in manufacturing industries, by economic use classification, based on the 1980 standard industrial classification (million dollars). Projected from 1982 Census of Manufactures benchmark.

Year and month	Shipments ¹							Unfilled orders at end of month						
	Consumer goods			Construction materials and components	Other intermediate goods & supplies	Export-oriented industries	Supplementary classification automotive products	Consumer Goods			Construction materials and components	Other intermediate goods and supplies	Export-oriented industries	Supplementary classification automotive products
	Non-durable and semi-durable	Durable	Capital goods					Non-durable and semi-durable	Durable	Capital goods

¹Separate industries series combined for the Supplementary Classification automotive products, are also components of other classifications. Other economic use classification groups are mutually exclusive and except for rounding differences add to relevant Canada totals in section 6, table 1.

Note: All series are subject to revision each year when more recent Census of Manufactures data become available.

¹Data compiled according to the Steel Distribution Index revised January, 1964. ²Figures on net shipments relate to semi finished and rolled steel products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ³Excluding shipments for re-processing at maker's own plant. ⁴Data compiled as submitted by the steel producers according to the steel industry distribution code.

¹Gas types are included. ²Includes producers' shipments for export. ³In some cases these shipments are not at the factory level, and stocks at beginning of month plus production less shipments do not equal stocks at end of month. ⁴End of period. ⁵Electric and other. ⁶Excludes apartment type machines. ⁷Excludes other than electric.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision.

¹Supply and disposition for both Crude Oil and Natural Gas will not agree because of losses, inventory changes, pipeline fuel used etc plus.

Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), Statistics Canada.

²Includes crude oil, condensate and pentanes

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. Source: Housing Starts and Completions (64-002), Statistics Canada.

¹Price indexes of inputs measure only changes in prices of units of inputs. They do not reflect other important changes in costs of production, such as changing quantities and productivity of inputs. They should not be interpreted, therefore, as equivalent to indexes of cost per unit of input. Direct comparison of them with price indexes of output can yield misleading indications of the changing relationship of costs and income. The price indexes for the last two years are subject to revision. ²The major groups include additional components than the selected ones shown

¹Total exports includes domestic exports and re-exports, for further information please refer to Summary of External Trade (65-001). ²The figures reflect a number of adjustments applied to the customs totals to make them consistent with the concepts and definitions used in the system of national accounts. For more information about these adjustments, please refer to Quarterly Estimates of the Canadian Balance of International Payments (67-001). ³For definition of major trading areas and sections, please refer to Summary of External Trade (65-001).

¹Data for 1970 through 1972 refer to class 1 and 2 carriers whose gross annual revenues totalled \$500,000 or more. Information for the period January 1973-December 1978 refers to only 6 major railways. Commencing January 1979, data for 7 major railways (accounting for 95 per cent or more of the total operating revenues) are shown.

Note: Components may not add to totals due to partial revisions.

¹End of period. ²Excluding Treasury Bills, Canada Savings Bonds and other non-market issues. ³Figures are subject to revision. Series cover all publicly announced issues and some private placements not publicly announced. Notes with an original term to maturity of over one year. ⁴Includes Canadian Pension Plan series bonds issued by the provinces and their agencies and purchased by the C.P.P. Investment Fund. ⁵Consists of issues of Canadian religious and other institutions and Canadian dollar issues of foreign debtors. ⁶Allowance for the take-over of Nova Scotia Light & Power common shares.
